

iNews DE

(iOS App)

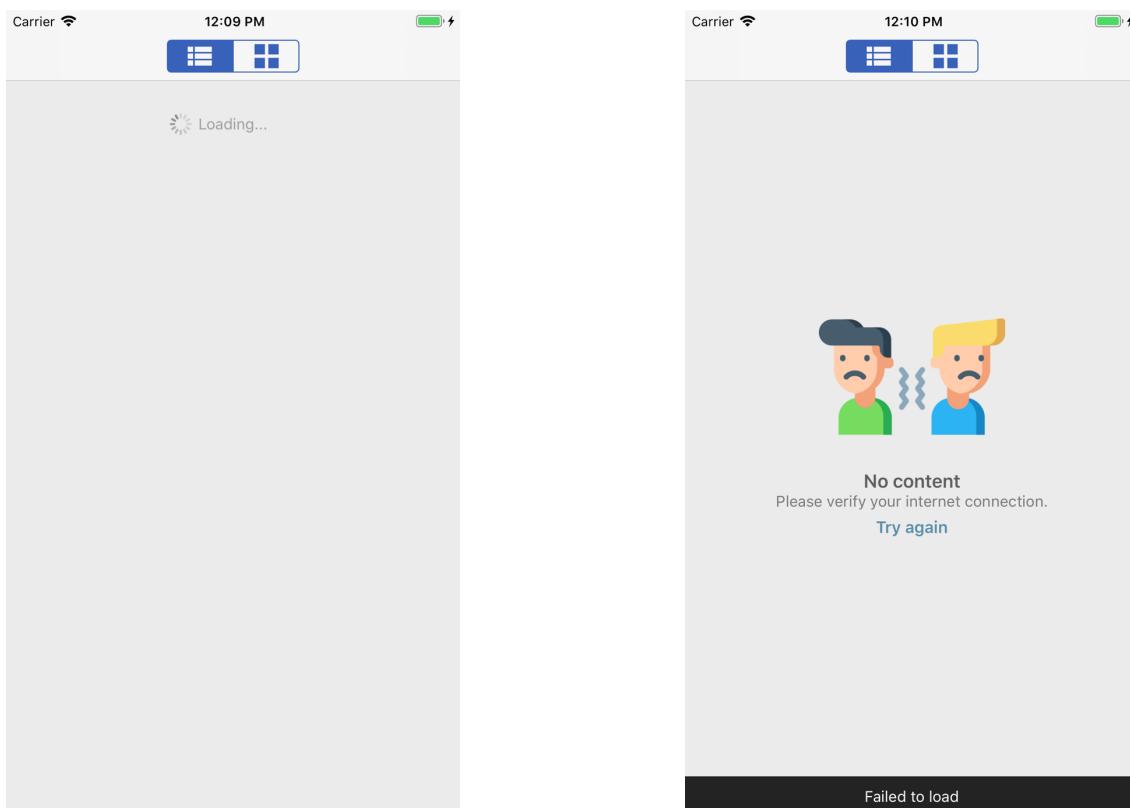

Description:

App for showing list of news from the website www.gamesundbusiness.de using their rest API:
www.gamesundbusiness.de/index.php?id=581

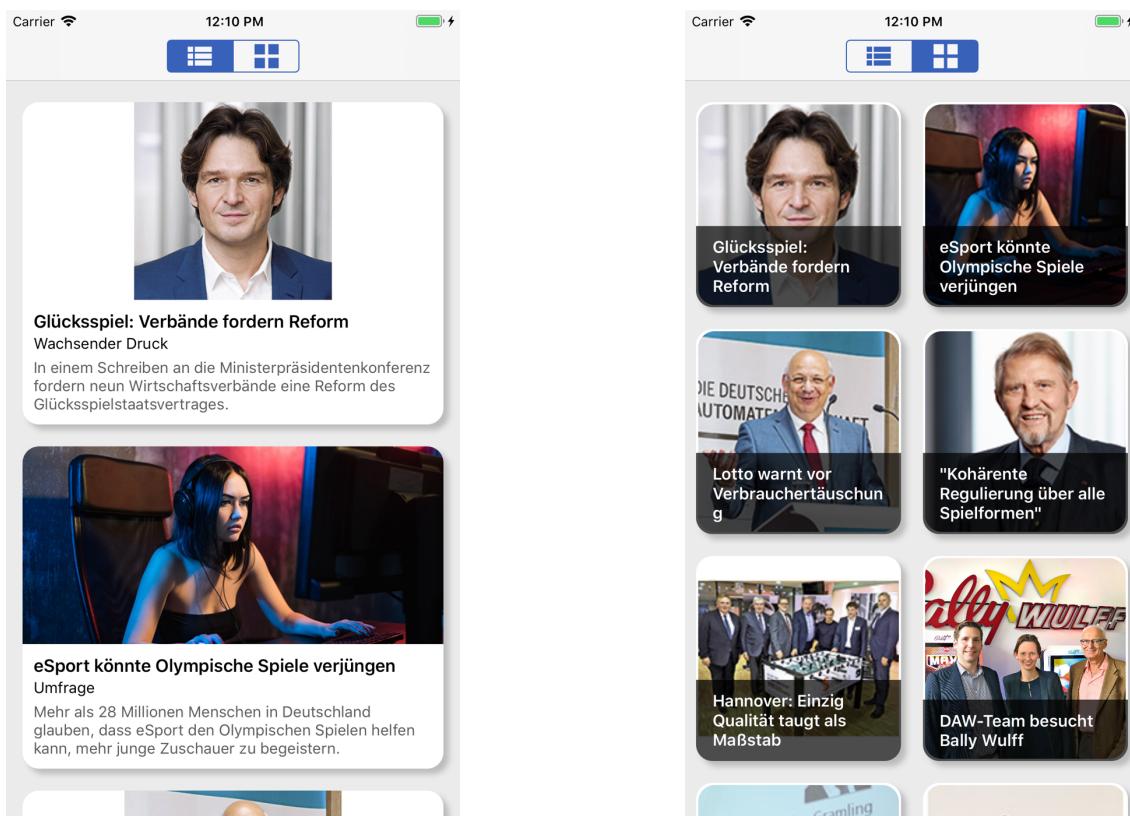

The app developed using GIT for source control (GIT data available in the project folder), and it's using 3 external frameworks:

- Alamofire: for calling the RESTful APIs
- SDWebImage: for downloading and caching images
- ESPullToRefresh: for the option pull to refresh

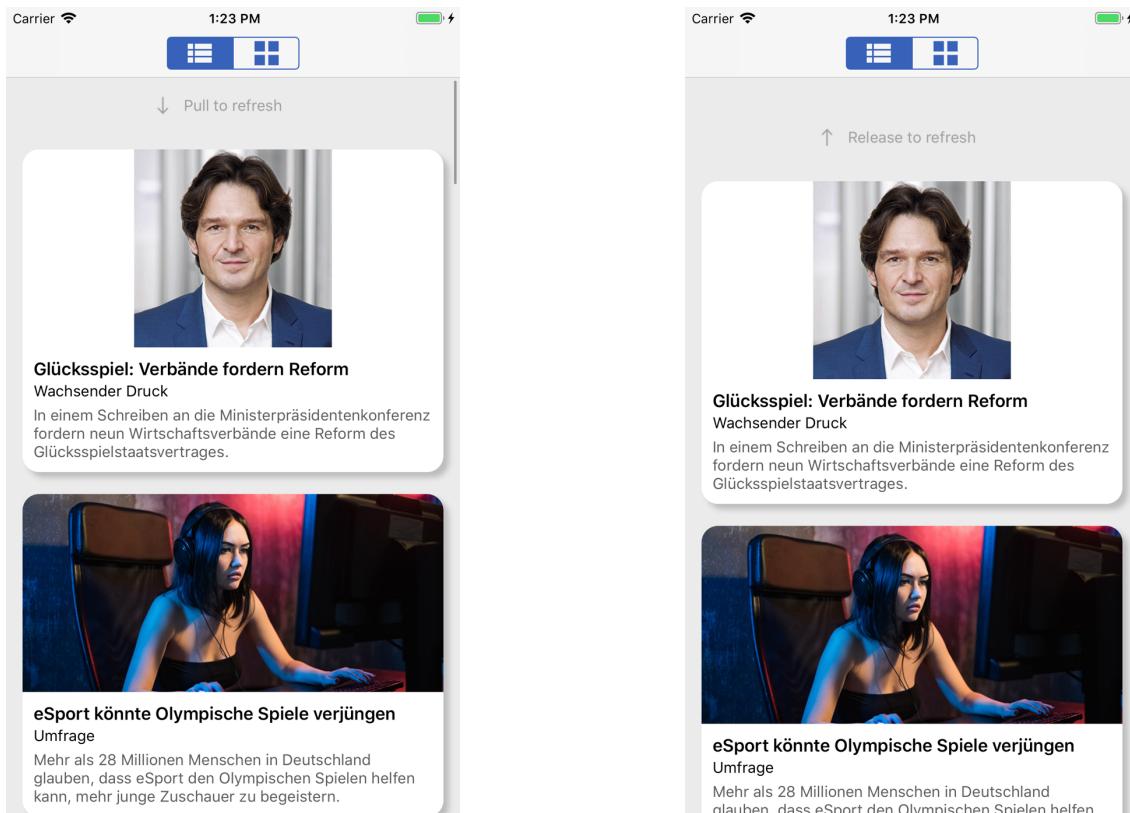

When the first time the app launch, it will download the news data from the web service, and if an error occurred a message will be shown indicate that there is no content to show and the user need to verify the internet connection and try again.

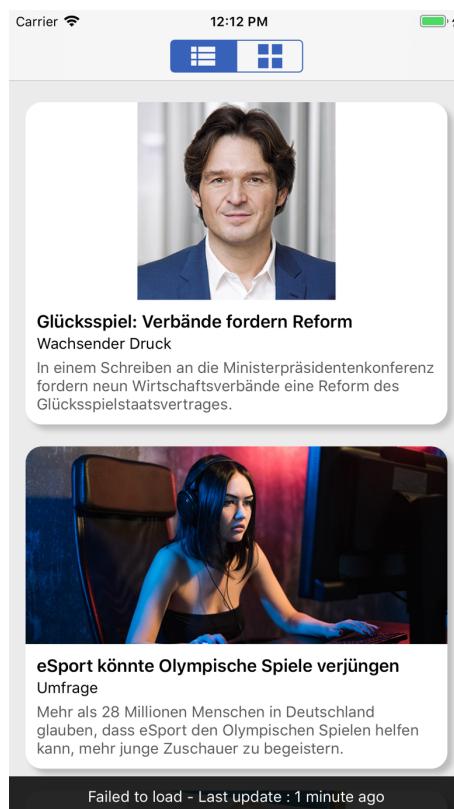

When the news data has been downloaded, they will be saved locally so the app can work offline. The news can be displayed into two modes: List or Grid

The user can refresh the data by pulling the list down.

If the app lunched and there is no active internet connection, the news data will be fetched from the local and a message will be shown indicating that the app can't fetch new content from the internet, and that the current content is from a time ago.

The user can tap any news item to see a full detail, a new view will open to show the full content. And also, he can go to the website of the selected news by just tapping the internet logo in the top of the news details view.
